

===== Resumen de actividad =====

 2025-01-27: 5 horas ◇ Commits del día: - Refactor TareaResponsableRequest class in tarea_responsable.py to inherit from BaseModel instead of PaginationRequest for improved clarity and functionality - Remove unused route imports from api_router.py for improved clarity and maintainability - Remove commented-out code from auth.py and common_controller.py for improved code clarity - Refactor server.py to improve application structure and add detailed startup logging; enhance middleware and router initialization - Add IDs to NotificationResponse and correct typo in TareaResponsableResponse for improved data accuracy - Remove transactional.py as it is no longer needed for database operations - Add DBContext class for database operations and remove unused code from dashboard_controller.py - Rename FastApiFunction to ApiServerlessFunction in infrastructure.yaml for improved clarity - Remove unused service files related to dashboard notifications and responsables for codebase cleanup - Refactor dashboard_controller.py to use DBContext for database operations and remove unused fetch functions for improved clarity and maintainability - Refactor getDonutPanel function in dashboard_controller.py to remove commented-out code and simplify data fetching logic for improved readability - Add AWS SAM template for FastAPI deployment with initial function configuration - Remove commented-out PaginationRequest class from notificaciones.py and tarea_responsable.py for improved code clarity

 2025-01-15: 2 horas ◇ Commits del día: - Refactor stored procedures to use a list structure for improved readability and error handling during execution - Refactor stored procedures for improved data types and add drop_procedures method; update server and service files accordingly

 2025-01-14: 4 horas ◇ Commits del día: - Add fetch_notificaciones service and corresponding database function; update dashboard controller to utilize new service - Refactor GetResponsable endpoint to use stored procedure for fetching responsables; update response handling and logging - Implement fetch_requirement_obligation service and update dashboard controller; modify response model fields for consistency - Add fetch_donut_panel service and corresponding database function; update dashboard controller to utilize new service - Rename variable for stored procedures in database module for clarity - Add fetch_total_solicitudes_revisor service and corresponding database function; update dashboard controller to utilize new service - Add fetch_expediente_civa service and corresponding database function; update dashboard controller to utilize new service - Add fetch_tareas_responsable service and corresponding database function; update dashboard controller to utilize new service

 2025-01-09: 6 horas ◇ Commits del día: - Add AreaRolModel and ResponsableModel, and update imports in schemas - Add DatosempresaEvidencialIDRequest model and update getEvidencialID endpoint - Add empty response model files for requirements - Add request models for ProveedorNacional and CaracterTipos, and update response schemas - Add request and response models for dashboard features including TotalSolicitudesRevisor, Notificaciones, ExpedienteCiva, RequerimientoObligaciones, DonutPanel, and TareaResponsable - Add request models for RazonSocial and DatosEmpresa endpoints and log requests - Update getSectionList endpoint to use SectionDatosEmpresaListRequest and add new request schema - Add SectionOptionDatosEmpresaResponse model and update getSectionList endpoint - Move response models for ExpedienteCiva and RequirementObligations to a new response module - Refactor response handling to replace PaginationBase with ListResponse in company data and requirements controllers - Add request and response models for LegalUso and EnlaceOperativo, and update related endpoints - Add request models for dashboard features including DonutPanel, ExpedienteCiva, Notificaciones, RequerimientoObligaciones, TareaResponsable, and TotalSolicitudesRevisor - Add request and response models for requerimientos,

including section options and hallazgos - Add empty request model files for hallazgo and requerimientos - Add request models for SocioAccionista and LegalUso, and update related endpoints - Remove obsolete response models for ExpedienteCiva and RequirementObligations, and add new ExpedienteCivaResponse model - Update response handling and refactor model imports in company data schemas; modify login response structure and adjust excluded URLs in config - Add request and response models for countries and states, and update schema imports - Add initial model imports in **init.py** for schema organization - Add DatosEmpresaEnlaceOperativoModel and update related imports in schemas

 2025-01-08: 2 horas ◇ Commits del día: - Refactor API response and request schemas for consistency and clarity - Chat GPT refactor - Refactor Chat GPT - Refactor GetResponsable function to simplify data handling and improve readability - Refactor company_data_controller to reorganize import statements for improved clarity - Chat GPT refactor 3

 2025-01-07: 5 horas ◇ Commits del día: - Rename API endpoints for consistency and clarity - Update ROUTE_PATH in configuration from '/app/v1' to '/api' - Update import path for Base model and comment out database seeding in server startup - Rename endpoint from '/get_responsible' to '/GetResponsable' for consistency - Rename login endpoint for consistency and clarity - Refactor company data API endpoints for consistency and clarity - Rename dashboard API endpoints for consistency and clarity

 2025-01-06: 3 horas ◇ Commits del día: - Refactor responsable schemas by consolidating request and response models into common files - Refactor requirements response schemas by removing obsolete file and consolidating response model - Add State and Client models to database initialization - Add black formatter to development requirements - Refactor dashboard schemas by consolidating response models and removing obsolete date request schema - Remove obsolete RequerimientosObligationsResponse import from company_data_controller and requirements_controller - Remove obsolete requirements response schema - Black Formatter applied - Refactor authentication schemas by consolidating request and response models into single files - Refactor responsable schemas by consolidating request and response models into single files

 2025-01-05: 4 horas ◇ Commits del día: - Update requirements controller endpoints to enhance request and response schemas - Refactor database models to enhance relationships and update schemas for clients, states, and notifications - Add company data controller to API router - Update getSolicitudID endpoint to enhance request and response schemas - Refactor dashboard controller endpoints to update request and response schemas for obligations, notifications, and tasks - Update company data controller endpoints to enhance request and response schemas - Refactor company data controller endpoints to update request and response schemas for legal use and related data - Add requirements controller to API router

 2025-01-03: 3 horas ◇ Commits del día: - Remove ResponseLogMiddleware and related classes to streamline middleware functionality - Add dashboard controller and implement requirements obligations endpoint with response schema - Refactor dashboard controller endpoints and add new functionality for obligations, notifications, and tasks - Add logging for error handling in GetResponsable and GetRequirementObligation endpoints - Add GetResponsable endpoint with pagination and response schema for fetching responsables - Refactor common_controller routes and update GetResponsable endpoint for improved error handling and response structure - Update documentation for GetResponsable endpoint to clarify request parameters - Remove user-related routes and schemas from the API, simplifying the router configuration

 2025-01-02: 5 horas ◇ Commits del día: - Add database seeding functionality: implement seed_database method to populate roles in the database during startup. - Remove SQLAlchemy middleware and related

session management: delete SQLAlchemyMiddleware and its references to streamline middleware components. - Add database backup instructions to README: include steps for creating and copying database backups using Docker - Add excluded URLs to LocalConfig for API access control - Enhance logging in database population and server initialization: prefix log messages with context identifiers for better traceability. - Add GetResponsible endpoint to retrieve responsables with role-based access control

2025-01-01: 1 hora ◇ Commits del día: - Add database models and table creation logic: implement models for countries, findings, responsables, and others; include async table creation in the database population script.

2024-12-30: 3 horas ◇ Commits del día: - Refactor database session management: streamline session handling with async session factory and update JWT configuration structure in config files - Add PostgreSQL Docker setup and initialization scripts - Update database configuration and add ORM models: restructure config.json for multiple databases and implement SQLAlchemy models for users, roles, tasks, and more. - Update database configuration to use PostgreSQL: modify connection strings and update config settings for one-core database

2024-12-22: 3 horas ◇ Commits del día: - Add Python version file: specify Python version 3.10.11 - Refactor configuration management: load production settings from JSON file and update default values - Move folders - Refactor configuration management: replace old config.json with updated version and adjust ROUTE_PATH format - Refactor logger configuration: move logger_config to config directory and update import paths - Refactor routing configuration: update ROUTE_PATH and clean up unused imports - Update requirements management: rename requirements file and regenerate requirements.txt - Add development requirements file: create dev-requirements.txt and include necessary packages - Refactor service structure: move auth and role_checker services to a new directory and update import paths

2024-12-18: 5 horas ◇ Commits del día: - Add user management routes and update authentication response structure - Refactor logger configuration: comment out existing logging setup and initialize logger for 'uvicorn.error' - Refactor Create function: rename dependency parameter for clarity - Refactor authentication logic: update token payload structure, enhance token generation with expiration, and modify user data handling - Refactor configuration management: load environment variables for app settings and update default values - Black Format - Implement logging for authentication middleware and application startup

2024-12-17: 1 hora ◇ Commits del día: - Refactor authentication schemas and responses: update field names to PascalCase and enhance ApiResponse structure - Refactor authentication module: rename token request/response schemas, implement login endpoint, and add JWT token creation logic

2024-12-16: 1 hora ◇ Commits del día: - Refactor authentication middleware and routes: update token verification logic and improve security handling

2024-12-14: 6 horas ◇ Commits del día: - Update README to reflect changes in virtual environment setup and main script execution - first commit - Implement authentication and response logging middleware; update requirements - Add configuration management and main application entry point - Refactor API router and schemas: remove old files and add updated implementations - Add .gitignore file to exclude common Python artifacts and environment files - Refactor authentication routes and middleware: update response handling and add verification endpoint - Refactor configuration settings and add initial FastAPI application structure - Add SQLAlchemy session management and transactional middleware; update requirements - Add

API router and include login routes - Refactor API structure: remove old router, add new auth routes and schemas
